Executive Summary

Sponsored by Genentech, Futurelab+ brought together a coalition of partners to develop an innovative, modular, 2-year biotechnology curriculum, along with instructional materials, to expose students and educators to the breadth of education and career pathways across biotechnology. To increase adoption and access to such curricula in California and beyond, the modular curriculum was designed to align with the [California Career Technical Education \(CTE\) Model Curriculum Standards for Biotechnology](#), meet at least 1 year of the [University of California \(UC\) science \(D\) subject requirement](#), and incorporate some of the three-dimensional learning innovations of the [Next Generation Science Standards](#) (NGSS). The 2-year biotechnology curriculum has four core units per year; each core unit has nine lessons and a lab that each take approximately 1 week to complete (9–10 weeks for the full unit). In total, the biotechnology curriculum has 72 lessons and eight labs that span 2 full instructional years. Because the Futurelab+ biotechnology curriculum is modular, teachers can select specific units and materials to design biotechnology courses that are relevant and appropriate for their students and teaching environments.

As an organizational partner, the American Institutes for Research® (AIR®) provided external feedback about alignment of the curriculum to the three sets of standards to Futurelab+ curriculum developers during the formative period of the biotechnology curriculum. AIR is now providing external feedback and evidence regarding each unit of the final curriculum’s alignment to each set of standards in three series of reports: CTE, UC science (D) subject requirement, and NGSS. The eight reports in the NGSS series provide feedback about aspects of NGSS in a sample of the curriculum (one lesson from each unit). Developers selected Lesson 4 (Golden Rice Case Study) from Unit 6 (Alternative Proteins) for this report. **This review was completed on materials received May 16, 2022, and has not been updated to reflect any revisions made to materials since then.**

Of note, because the primary design element of the curriculum was alignment to CTE, AIR used the NGSS Lesson Screener (not the Educators Evaluating the Quality of Instructional Products [EQuIP] Rubric) to identify aspects of the curriculum that incorporate NGSS. The EQuIP Rubric is typically used to determine whether a unit was designed for the NGSS. **Because the curriculum was designed to align primarily to CTE standards, it was not expected that the curriculum would meet all NGSS criteria.** Nevertheless, in their current form, the materials from Unit 6, Lesson 4, **meet one and approach four of the six criteria.** AIR created the *approaching* rating to indicate where a modification to materials would increase the rating to *adequate*. NGSS criteria, ratings, and recommendations are summarized in Exhibit 1.

Exhibit 1. NGSS Criteria, Ratings, and Recommendations

Criterion		Rating
NGSS Shifts	A. Explaining Phenomena or Designing Solutions	Approaching
	B. Three Dimensions	<ul style="list-style-type: none"> ▪ DCI: Adequate ▪ SEP: Adequate ▪ CCC: Inadequate Overall rating: Approaching
	C. Integrating the Three Dimensions for Instruction and Assessment	Approaching
Features of Quality Design	D. Relevance and Authenticity	Adequate
	E. Student Ideas	Approaching
	F. Building on Students’ Prior Knowledge	Inadequate

Note. DCI = disciplinary core ideas; SEP = science and engineering practices; CCC = cross-cutting concepts.

- **Criterion A: Explaining Phenomena or Designing Solutions** (*Approaching*). Although all lessons center on Golden Rice as a case study of a solution to a problem, students are reading about the problem and solution rather than designing (or recommending) their own potential solution.
- **Criterion B: Three Dimensions** (*Approaching*). Activities are primarily focused on practices and core ideas, but do not address cross-cutting concepts although there are natural connections to do so.
- **Criterion C: Integrating the Three Dimensions for Instruction and Assessment** (*Approaching*). Activities are focused on gathering evidence of student understanding of practices and a core idea, but do not address cross-cutting concepts although there are natural connections to do so.
- **Criterion D: Relevance and Authenticity** (*Adequate*). Vitamin deficiencies and genetic modification of food are very important topics that can be difficult for students to relate to if they do not have prior experience with these or similar issues. While effort was taken to help students see cultural connections, students may still struggle with the relevance of addressing vitamin A deficiency without the opportunity to draw connections to their own experiences.
- **Criterion E: Student Ideas** (*Approaching*). Several opportunities and activities are included to allow peer interaction and student reasoning. However, the extent to which students can reflect on and change their thinking is not clear.
- **Criterion F: Building on Students' Prior Knowledge** (*Inadequate*). Materials in their current form may build on students' prior knowledge in some content, but connections need to be strengthened to meet the criterion.

AIR's review also included feedback regarding alignment of the lesson to three of the eight Futurelab+ guiding principles: equity, adaptability, and industry driven. Unit 6, Lesson 4 materials met all three of these guiding principles:

- **Equity.** Materials do not appear to include any barriers for students and include diverse representation across materials. Materials include scaffolded supports for teachers to help students develop cultural competency and explore unconscious biases. Students and teachers may need additional supports related to Filipino culture and foods. Students may miss important concepts if they are unfamiliar with these elements of Filipino society.
- **Adaptability.** Materials appear to be adaptable to virtual, in-person, or hybrid settings. However, this assumes students have previously engaged with the websites or tools used in this lesson. Students may need a guided, in-person introduction to these digital tools.
- **Industry Driven.** The content for Unit 6, Lesson 4, appears to be industry driven. Several role profiles are included, and the activity for which students brainstorm the soft skills required for a particular role they will assume is a great way to encourage students to “think like a biotech scientist.”

Methodology

Released in 2013, the NGSS were developed by a consortium of states, teacher associations, and nonprofit organizations. The purposes of NGSS are to (1) combat ignorance of science, (2) create common teaching standards, and (3) develop greater interest in science among students so that more students choose to major in science or technology. The focus on the purposes requires changes in how science is taught and the materials used to teach science. These changes, or innovations, shift the focus of science instruction from an abstract recall of facts to students demonstrating proficiency by engaging in scientific practices.

Three dimensions are integrated into the NGSS and throughout NGSS-aligned materials: SEPs, CCCs, and DCIs.

Methods

The 2-year biotechnology curriculum consists of four core units each year. Each core unit has nine lessons and a lab. As is typical with NGSS-aligned lessons, a lesson consists of more than one class period of instruction to allow students the opportunity to develop their knowledge and understanding more fully. Lessons and labs take approximately five 45-minute instructional periods to complete. In its entirety, the biotechnology curriculum has 72 lessons and eight labs and covers 2 instructional years.

AIR was asked to provide feedback and evidence of incorporation of some of the three-dimensional learning innovations common to the NGSS on a sample of the biotechnology curriculum. **Because the curriculum was designed to align primarily to CTE standards, it was not expected that the curriculum would meet all NGSS criteria.**

In addition, there are significant similarities between the innovations measured by the NGSS Lesson Screener and the [University of California \(UC\) science \(D\) subject requirement](#), as shown in Exhibit 2. For this reason, AIR selected to use the NGSS Lesson Screener for supporting evidence of three-dimensional learning.

Exhibit 2. Similarities Between UC Science Requirements and Measured Innovations

There are significant similarities between the [UC science \(D\) subject requirement](#) and the [NGSS Lesson Screener](#) criteria. Specific course content guidelines of the [A–G Policy Resource Guide](#) are briefly summarized here, with notations about which Lesson Screener criteria include the same or similar requirements.

- Explicitly integrate the eight NGSS SEPs (Lesson Screener Criteria B and C); this requirement is mentioned multiple times.
- Draw content generally from the NGSS (Lesson Screener Criteria B and C) and Common Core State Standards for Literacy in History/Social Studies, Science, and Technical Subjects.
- Provide opportunities for students to participate in all phases of the scientific process and require students to discuss ideas with other students (Lesson Screener Criteria B, C, D, and E).
- Be explicit about formative and summative assessment practices (Lesson Screener Criteria B, C, and E).
- Include real-world problems that engage all students in science learning (Lesson Screener Criteria A, D, and E).
- Specify minimum mathematics course requirements.
- Reserve at least 20% of class time for teacher-supervised, hands-on laboratory activities.
- Incorporate technology (to the extent possible) to increase access and computer-based skills for students.

NGSS Lesson Screener

The [NGSS Lesson Screener](#), developed by Achieve in collaboration with the National Science Teaching Association, is a framework for collecting evidence on (1) whether a lesson being developed or revised is on the right track for incorporating NGSS innovations, (2) if a lesson warrants further review using the EQuIP Rubric, and (3) to what extent a group of reviewers have a common understanding of the NGSS or of designing lessons for the NGSS. Because these materials were designed primarily to align to CTE standards, with aspects of NGSS and three-dimensional learning incorporated, using the Lesson Screener was more appropriate than using the EQuIP Rubric.

The NGSS Lesson Screener includes six criteria (labeled A–F). The first three Lesson Screener criteria (A–C) consider evidence of three NGSS shifts: (A) Explaining Phenomena or Designing Solutions, (B) Three Dimensions (of learning), and (C) Integrating the Three Dimensions for Instruction and Assessment. The last three NGSS criteria (D–F) consider features of quality design: (D) Relevance and Authenticity, (E) Student Ideas, and (F) Building on Students’ Prior Knowledge.

Each screener criterion lists several indicators that help determine the extent to which a lesson incorporates an innovation. In other words, these indicators, or descriptions, denote whether the lesson materials meet a criterion. **A rating of adequate or higher means that the lesson meets the criterion.**

Possible criterion ratings on the NGSS Lesson Screener include the following:

- None (no evidence to meet the criterion)
- Inadequate (limited evidence to meet the criterion or direct evidence that the materials are not aligned)
- Adequate (enough evidence to meet the criterion)
- Extensive (more than enough evidence to meet the criterion)

For this curriculum review, AIR added an *approaching* rating to the NGSS criterion ratings. This new rating indicates where a modification to materials would increase the rating to *adequate*.

Sampling

To complete the series of NGSS Lesson Screener reviews, AIR sampled one lesson in each of the eight core units for a total of eight NGSS alignment and evidence reviews. **AIR randomly selected four of the lessons; the other four lessons were re-reviews of materials AIR reviewed during the formative review process.** Developers selected Lesson 4 (*Golden Rice Case Study*) from Unit 6 (*Alternative Proteins*).

Two AIR staff independently and then collaboratively reviewed Unit 6, Lesson 4, to provide impartial evidence of where in the lesson and to what extent NGSS innovations are incorporated. After each AIR reviewer independently completed the review and provided a rationale for the ratings on each indicator, the team met to arrive at a final rating for each criterion (see Exhibit 3).

Exhibit 3. Lesson Review Process

Following the Lesson Screener standard review protocol, the AIR review team

- individually reviewed the lesson to record criterion-based evidence,
- individually made suggestions for improvement,
- collaboratively discussed findings to make a final rating determination, and
- summarized findings into a report.

Feedback and Evidence: Unit 6, Lesson 4

AIR found evidence that Unit 6, Lesson 4, materials meet one and approach four of the six criteria. All six criteria and evidence supporting AIR's ratings are discussed in detail in this section (see summary in Exhibit 1).

NGSS Ratings and Evidence

Rating for Criterion A: Explaining Phenomena or Designing Solutions: *Approaching*

Although all lessons center on Golden Rice as a case study of a solution to a problem, students are reading about the problem and solution rather than designing (or recommending) their own potential solution. The materials are approaching this criterion and can meet it by providing multiple avenues for students to relate to the materials, for example, by including student reflection questions about their prior knowledge with vitamin deficiency and/or genetically engineered foods. Another way to approach student relevancy (and several other criteria) would be to have student groups act as researchers trying to solve for vitamin deficiencies within a community of their choosing, using the Golden Rice case study as an example for them to draw upon.

Rating for Criterion B: Three Dimensions: *Approaching*

The reviewers found that the materials provide opportunities to build understanding in **two dimensions**. Specifically, activities focus on student understanding of practices and core ideas but do not address cross-cutting concepts, although natural connections exist to do so.

SEPs, including:

- **Developing and Using Models.** Create a flowchart that illustrates and describes in detail how Golden Rice is manufactured and commercialized (Student Section, p. 39).
- **Engaging in Argument from Evidence.** Make an initial claim about whether Golden Rice is the best solution to the problem of vitamin A deficiency (Student Section, p. 47).

DCIs, including:

- **LS1-C.** The sugar molecules thus formed contain carbon, hydrogen, and oxygen: Their hydrocarbon backbones are used to make amino acids and other carbon-based molecules that can be assembled into larger molecules (such as proteins or DNA), used for example to form new cells (Teacher Section, p. 12).

Rating for Criterion C: Integrating the Three Dimensions for Instruction and Assessment: *Approaching*

The reviewers found that the materials provide opportunities to build and assess understanding of grade-appropriate elements in **two dimensions**. Specifically, activities focus on student understanding of practices and core ideas but do not address cross-cutting concepts, although natural connections exist to do so.

SEPs, including:

- **Developing and Using Models.** Create a flowchart that illustrates and describes in detail how Golden Rice is manufactured and commercialized (Student Section, p. 39).
- **Engaging in Argument from Evidence.** Make an initial claim about whether Golden Rice is the best solution to the problem of vitamin A deficiency (Student Section, p. 47).

DCIs, including:

- **LS1-C.** The sugar molecules thus formed contain carbon, hydrogen, and oxygen: Their hydrocarbon backbones are used to make amino acids and other carbon-based molecules that can be assembled into larger molecules (such as proteins or DNA), used for example to form new cells (Teacher Section, p. 12).

Rating for Criterion D: Relevance and Authenticity: *Adequate*

The reviewers found adequate evidence that materials are relevant and authentic for students. Note, however, that vitamin deficiencies and genetic modification of food are very important topics that can be difficult for students to relate to if they do not have prior experience with these or similar issues. Students may still struggle with the relevance of addressing a vitamin A deficiency without the opportunity to draw connections to their own experiences. Materials can be strengthened by offering students the opportunity to reflect on and share their experiences with vitamin deficiencies.

The following bulleted evidence supports the *adequate* rating for this criterion:

- **Day 1 Whole Group.** Students share what they already know about the Philippines and any climate and cultural similarities to their own community (Teacher Section, p. 5).
- **Recap Assessment Capture Sheet.** Students share a food or crop that has some cultural importance for them (Student Section, p. 37).

Rating for Criterion E: Student Ideas: *Approaching*

The reviewers found evidence that the materials provide students with opportunities and activities to allow peer interaction and student reasoning; however, the extent to which students can reflect on and change their thinking is not clear.

The following bulleted evidence supports the *approaching* rating for this criterion:

- **Day 1 Whole Group.** The materials introduce students to Golden Rice through an opening claim activity, during which students are shown two types of rice and are asked to make a claim about which type is genetically modified (Teacher Section, p. 5).

Rating for Criterion F: Building on Students' Prior Knowledge: *Inadequate*

The reviewers found inadequate evidence that the materials identify and build on students' prior learning in all three dimensions because the materials make little to no connection between expected prior learning in the CCCs and learning in the unit. The materials in their current form suggest that students are applying learning from previous lessons in this unit to vitamin deficiencies or genetically modified or engineered products; however, the progression that builds on students' prior knowledge is not explicit, and there are limited opportunities for students to question or share prior knowledge.

Futurelab+ Design Principles

Although several Futurelab+ design principles (Exhibit 4) overlap with the Lesson Screener criteria, especially concerning Principle 1 (Equity) and Principle 6 (Education Standards Aligned), AIR was asked to look for evidence of the design principles independent of NGSS. Within this section, AIR provides feedback regarding the principles of Equity, Adaptability, and Industry Driven.

Feedback about the principle of Education Standards Aligned can be surmised from the CTE alignment matrix and summary evidence reports provided for each unit.

Feedback about the principle of California Focus can be surmised from the California Subject Matter D report prepared for each unit. No formal evaluation tool was created or used to provide this feedback.

Feedback is not provided about all principles because the focus of other principles relates to the design of the materials.

Exhibit 4. Futurelab+ Principles

1. **Equity | Prioritize** meeting the needs of the most **underserved students** using socially responsible language.
2. **Adaptability |** Empower and equip teachers and students to **seamlessly move between virtual and in-person learning** environments.
3. **Industry Driven |** Reflect **in-demand biotech skills** and **career-laddering opportunities**.
4. **Teacher Voice |** Informed by **teacher input** and must be **teacher-demand driven**.
5. **Teaching Breadth and Inclusivity |** Build to engage a **broad set of teachers**.
6. **Education Standards Aligned |** Demonstrate **relevance** and **validity** with educators.
7. **Open Source |** Opt for **open frameworks** over proprietary approaches.
8. **California Focus |** Prioritize **California state standards and educational contexts** as a foundation for future scaling efforts nationwide.

Equity

The materials include diverse representation and do not appear to include any barriers for students. The materials include scaffolded supports for teachers to help students develop cultural competency and explore unconscious biases. Students and teachers may need additional supports related to Filipino culture and foods. Students may miss important concepts if they are unfamiliar with these elements of Filipino society.

Adaptability

The materials appear to be adaptable to virtual, in-person, or hybrid settings. However, this assumes students have engaged with the websites or tools used in this lesson prior to this lesson. Students may need a more guided, in-person introduction to these digital tools.

Industry Driven

The content for Unit 6, Lesson 4, appears to be industry driven. The materials include several role profiles, and the activity for which students brainstorm the soft skills required for a particular role they will assume is a great way to encourage students to “think like a biotech scientist.”

Appendix A. Lesson Screener Criteria

	Criterion	Description
NGSS Shifts	A. Explaining Phenomena or Designing Solutions	The lesson focuses on supporting students to make sense of a phenomenon or design solutions to a problem.
	B. Three Dimensions	The lesson helps students develop and use multiple grade-appropriate elements of the SEPs, DCIs, and CCCs, which are deliberately selected to aid student sensemaking of phenomena or designing of solutions.
	C. Integrating the Three Dimensions for Instruction and Assessment	The lesson requires student performances that integrate elements of the SEPs, CCCs, and DCIs to make sense of phenomena or design solutions to problems, and the lesson elicits student artifacts that show direct, observable evidence of three-dimensional learning.
Features of Quality Design	D. Relevance and Authenticity	The lesson motivates student sensemaking or problem solving by taking advantage of student questions and prior experiences in the context of the students' homes, neighborhoods, and communities, as appropriate.
	E. Student Ideas	The lesson provides opportunities for students to express, clarify, justify, interpret, and represent their ideas (i.e., making thinking visible) and to respond to peer and teacher feedback.
	F. Building on Students' Prior Knowledge	The lesson identifies and builds on students' prior learning in all three dimensions in a way that is explicit to both the teacher and the students.

Note. DCI = disciplinary core ideas; SEP = science and engineering practices; CCC = cross-cutting concepts.

About the American Institutes for Research

Established in 1946, the American Institutes for Research® (AIR®) is a nonpartisan, not-for-profit organization that conducts behavioral and social science research and delivers technical assistance both domestically and internationally in the areas of education, health, and the workforce. AIR's work is driven by its mission to generate and use rigorous evidence that contributes to a better, more equitable world. With headquarters in Arlington, Virginia, AIR has offices across the U.S. and abroad. **For more information, visit www.air.org.**
